

Quiz Funnel Build Submission

Shopify quiz-to-offer funnel built for the eJam CRO assignment

Live storefront: <https://wybmic-ua.myshopify.com>

Access: The storefront is public. Shopify staff/admin access is handled separately through the staff invite requested in the assignment.

Submission folder: docs/Submission-Folder, zipped as the self-contained evidence package.

I built this as a working Shopify funnel, not a static mockup: landing page, offer selection, quiz, plan review, cart handoff, Meta Pixel verification, PageSpeed reports, device screenshots, and Playwright coverage are all included in the submission package.

What I Built

I rebuilt the Pestie-style quiz funnel for BugMD Pest Defense Pro inside Shopify, adapting the structure to BugMD branding, the provided product assets, the annual/quarterly/one-time pricing model, and the CRO goal of moving a shopper cleanly from interest to checkout.

- Landing page introduces the offer, trust signals, savings framing, kit contents, guarantee, FAQs, and the primary CTA.
- Offer page lets the shopper choose quarterly, annual, or one-time before entering the quiz.
- Quiz gathers goal, ZIP, home size, and pest context, then reviews the selected plan before checkout.
- Shopify cart receives the correct SKU, price, selling plan behavior, and quiz metadata.

Requirement Coverage

Assignment area	What I completed	Evidence
Shopify setup	Configured the Pest Defense Pro product, variants, subscription paths, pricing, and theme templates.	Shopify-Product-Setup.png; Shopify-Product-Setup-Notes.md
Full functionality	Built landing -> offer -> quiz -> review -> cart/checkout with plan and home-size logic.	Live store; Playwright Tests folder
Responsive design	Designed mobile-first and checked iOS Safari, Android Chrome, and desktop Chrome.	Mobile and Desktop Screenshots folder

Brand fidelity	Used BugMD colors, logo, Lexend/Bebas assets, real silver-packaging product imagery, and direct BugMD voice.	Final screenshots; assets and theme files
CRO thinking	Added trust proof, savings language, plan anchoring, guarantee, progressive commitment, and review-step confirmation.	Landing/product/quiz screenshots
Tracking	Installed Meta Pixel ID 779746252761607 through Shopify Customer Events and verified standard plus custom funnel events.	Facebook Pixels folder; Facebook Pixels/Meta-Pixel-Tracking-Notes.md
Automated testing	Added Playwright tests for plan selection, quiz completion, correct SKU, price, selling plan, and cart attributes.	Submission-Folder/Playwright Tests
Performance	Ran PageSpeed Insights on landing, product, and quiz pages across mobile and desktop.	PageSpeed Insights folder
AI usage	Used AI to accelerate coding and review while I directed the architecture, prompts, QA, and final decisions.	Process summary below
A/B testing	Added a lightweight quiz experiment that compares the specific pest-selection flow against a shorter common-area pests flow.	AB Testing folder

Shopify Product Logic

I treated Shopify as the source of truth for ecommerce behavior. The theme finds variants by SKU at runtime instead of hardcoding live Shopify variant IDs, which keeps the funnel easier to maintain if Shopify regenerates IDs or the product is adjusted.

Customer choice	SKU / variant behavior	Cart behavior
-----------------	------------------------	---------------

Quarterly subscription	Standard BG-PDP2CNBT-03 or XL BG-PDP2CNBT-03-XL based on home size.	\$45 standard or \$59 XL with quarterly selling plan.
Annual prepay	Standard BG-PDPCNANN-08 or XL BG-PDPCNANN-08-XL based on home size.	\$140 standard or \$196 XL with annual selling plan.
One-time purchase	Uses the Quarterly Kit SKU, standard or XL based on home size.	\$55 standard or \$69 XL with no selling plan.

The quiz stores the shopper's ZIP, home size, selected plan, coverage recommendation, and quiz variant as cart/order attributes so the admin side keeps the decision context without cluttering the customer-facing checkout line item.

Tracking And Pixel Verification

I installed the Meta Pixel through Shopify Customer Events rather than hardcoding it into the theme. That keeps the implementation aligned with Shopify's pixel sandbox and avoids duplicate fbq installs.

- Pixel ID used: 779746252761607.
- Standard events covered: PageView, ViewContent, AddToCart, InitiateCheckout, and Purchase when Shopify emits the lifecycle event.
- Custom funnel events covered: LandingViewed, LandingCtaClicked, OfferViewed, PlanSelected, OfferCtaClicked, QuizStarted, QuizStepViewed, QuizStepCompleted, QuizValidationError, QuizCompleted, CheckoutClicked, and ExperimentViewed.
- Payloads intentionally avoid raw ZIP code, names, emails, addresses, or other PII; they use safe fields such as has_zip, pest_count, selected_plan, step_name, quiz_variant, and coverage_recommendation.

A/B Testing

I added a lightweight A/B testing layer because the brief rewards CRO thinking beyond the literal build. The experiment tests whether a shorter quiz path can reduce friction while still keeping the plan relevant.

- Control: pest_selection asks shoppers to choose specific pests before the plan review.
- Variant: common_area_pests skips that step and frames the recommendation around common seasonal pests in the shopper's area.
- Assignment uses URL overrides for QA, then localStorage for sticky browser assignment, then a 50/50 fallback when no value exists.
- Tracking includes ExperimentViewed and quiz_variant on relevant funnel events so the test can be evaluated later without sending raw ZIP or other PII.
- Evidence is included in docs/Submission-Folder/AB Testing with screenshots and implementation notes.

Automated Test Coverage

I wrote the Playwright test to verify the actual conversion contract, not just whether buttons can be clicked. It walks the funnel, adds the selected plan to Shopify cart, reads /cart.js, and asserts the SKU, price, quantity, selling plan allocation, and metadata.

- Six plan/home-size scenarios: annual standard, annual XL, quarterly standard, quarterly XL, one-time standard, and one-time XL.
- One A/B variant scenario confirms the common-area pest path can skip the pest selection step without sending a Selected Pests line item property.
- The copied submission files are funnel.spec.js, playwright.config.js, and README.md inside docs/Submission-Folder/Playwright Tests.

PageSpeed Results

Page	Mobile	Desktop	Key result
Landing	80 performance / 93 accessibility	99 performance / 93 accessibility	CLS stayed low at 0.007 mobile and 0.005 desktop.
Product/offer	91 performance / 92 accessibility	99 performance / 92 accessibility	Desktop LCP 0.7s; mobile LCP 3.2s under Slow 4G throttling.
Quiz funnel	90 performance / 96 accessibility	100 performance / 96 accessibility	Fastest core path: desktop FCP 0.4s, LCP 0.6s, TBT 20ms.

The main optimization choices were keeping the funnel code scoped, using real compressed product assets, avoiding unnecessary third-party scripts in the theme, using responsive images, and keeping the quiz interaction lightweight.

Device QA

I tested the core funnel screens across the required environments and saved screenshots for review. The screenshot set includes landing, quiz, and product/get-plan states for iOS Safari, Android Chrome, and desktop Chrome.

- iOS: IOS-Landing-Page.PNG, IOS-Funnel-Quiz.PNG, IOS-Product-Page-First-Half.PNG, IOS-Product-Page-Get-Plan.PNG.
- Android: Android-Landing-Page.png, Android-Funnel-Quiz.png, Android-Product-Page-First-Half.png, Android-Product-Page-Get-Plan.png.
- Desktop: Desktop-Landing-Page.png, Desktop-Funnel-Quiz.png, Desktop-Product-Page-Get-Plan.png.

How I Used AI

I used AI as my development accelerator, but I operated the build. I researched the Pestie flow, translated the assignment into the Shopify/product/tracking/testing requirements, reversed engineered pestle funnel, decided the funnel architecture, and used AI to help write, refactor, and inspect code faster.

My role was to direct the work: I supplied the constraints, checked generated code against Shopify behavior, corrected assumptions around SKUs and selling plans, tested the cart contract, and iterated until the implementation matched the brief. I did not treat AI output as finished just because it compiled; I used it like a very fast pair programmer and QA assistant.

Final Submission Checklist

1. Working live URL: <https://wybmic-ua.myshopify.com>.
2. No storefront password is needed because the storefront is public.
3. Shopify staff/admin access is handled separately through the Shopify invite requested in the assignment.
4. Automated test script and explanation included in docs/Submission-Folder/Playwright Tests.
5. Meta Pixel screenshots, PageSpeed reports, cross-device screenshots, and Shopify product setup screenshot included in docs/Submission-Folder.
